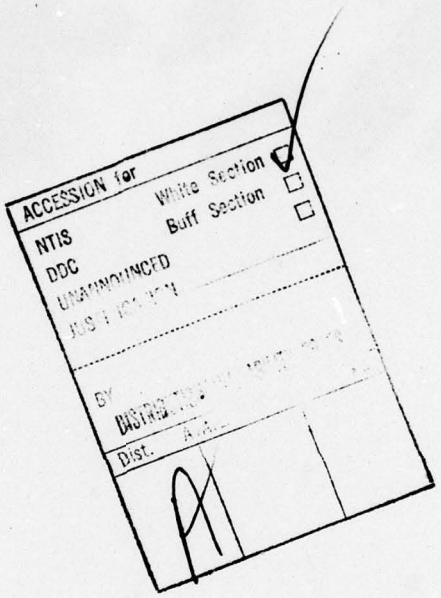
PHASE I INSPECTION REPORT

TABLE OF CONTENTS



PHASE 1 REPORT
NATIONAL DAM SAFETY PROGRAM

Name of Dam:	Batavia Kill Watershed Project Dam No. 3 - I.D. No. NY-608 (#191C-3818)
State Located:	New York
County Located:	Greene
Watershed:	Mohawk River Basin
Stream:	an unnamed tributary to the Batavia Kill (a tributary to the Schoharie Creek)
Date of Inspection:	July 11, 1978

ASSESSMENT

The Batavia Kill Watershed Project Dam No. 3 is a floodwater retarding structure. The earth fill structure was impounding water at the time of inspection to an elevation just above the principal spillway crest. Examination of available documents and a visual inspection of the dam did not reveal conditions which are considered to be unsafe.

The total discharge capability of the spillways is adequate for the Probable Maximum Flood (PMF).

SECTION 1: PROJECT INFORMATION

1.1 GENERAL

a. Authority

The Phase 1 Inspection reported herein was authorized by the Department of the Army, New York District, Corps of Engineers, to fulfill the requirements of the National Dam Inspection Act, Public Law 92-367.

b. Purpose of Inspection

To evaluate the existing conditions of the dam, to identify deficiencies and hazardous conditions, determine if they constitute hazards to life and property, and recommend remedial measures where necessary.

1.2 DESCRIPTION OF PROJECT

a. Description of the Dam and Appurtenant Structures

The Batavia Kill Watershed Project (BKWP) Dam No. 3 is an earthfill embankment having a principal spillway passing through it and two emergency spillways flanking it.

The 63 foot high, zoned compacted embankment has a crest length of 1100 feet and crest width of 20 feet. The upstream slope is 1 vertical on 3 horizontal and the downstream slope is 1 vertical on 2.5 horizontal. The crest and exposed slopes are heavily grass covered. That portion of the upstream slope below the level of the principal spillway crest did not appear to be riprapped. An earth cutoff trench of varying depth and width keys the embankment to the underlying foundation soils. Rock-lined channels extend outward on each side from the outlet channel, along the toe of the embankment.

The principal spillway consists of a rectangular reinforced concrete drop inlet structure, a 30 inch diameter reinforced concrete pressure pipe with anti-seepage collars, an impact basin, and an outlet channel. Two emergency spillways, one each side, flank the embankment. Both are located in earth cuts and are heavily grass-lined.

An internal drainage system consisting of 10 inch diameter fully bituminous coated perforated corrugated metal pipe is located beneath the downstream slope of the embankment. Seepage is collected and conducted through this drain and outleted through the side walls of the impact basin. The reservoir drain consisting of a 16 inch diameter

cast iron pipe extends from the upstream embankment toe to the base of the principal spillway riser. A vertical slide gate mechanism mounted along the inside of the riser controls the flow through the reservoir drain.

b. Location

BKWP Dam No. 3 is located on an unnamed tributary to the Batavia Kill, a tributary to the Schoharie Creek, approximately 1.5 miles Northeast of the village of Windham along Nauvo Road in the Town of Windham, New York.

c. Size Classification

This dam is 63 feet high and is classified as an "intermediate" dam (between 40 and 100 feet high).

d. Hazard Classification

The dam is classified "high" hazard because of the presence of approximately 60 homes and multiple-dwelling units downstream, including the village of Windham.

e. Ownership

This dam is owned by the Batavia Kill Watershed District of Windham, New York.

f. Purpose of Dam

The dam's primary purpose is for retarding floodwaters.

g. Design and Construction History

This dam and appurtenant structures were designed by the U.S. Department of Agriculture, Soil Conservation Service (SCS). Construction of the embankment began in 1970 and was completed the same year. The SCS office having jurisdiction for Greene County has a design folder containing hydrologic, hydraulic, and structural design information, the design calculations for modifications made during construction, and the as-built contract plans and documents.

h. Normal Operating Procedures

Water releases from the reservoir over the principal spillway. This structure has sufficient capacity to discharge a 100 year flood without flow occurring in the emergency spillways. For storms greater than the 100 year flood, flow will discharge through the two emergency spillways.

1.3 PERTINENT DATA

a. Drainage Area (acres)	2304
b. Discharge at Dam (cfs)	
Total (of all facilities excluding reservoir drain) @ Maximum High Water	17600
Principal Spillway @ Maximum High Water	132
Principal Spillway @ Emergency Spillway Crest Elevation	125

Crest width (ft)		20

g. Spillway

Principal Spillway (Service):

Type: Uncontrolled, reinforced concrete drop inlet (2.5 x 7.5 ft) rising 18 feet; 30 inch reinforced concrete pressure conduit 326 feet long; an impact basin; an outlet channel.

Length (ft): Weir		15.0

Emergency Spillway (Auxiliary):

Type: Two grass-lined channels having trapezoidal cross sections

Bottom Width (ft):	East	50
	West	200
Side Slopes (V : H)		1:3
Length of level section (in profile) (ft)		50
Exit Slope (V : H)		1:32

h. Regulating Outlet

Reservoir Drain:

Type: 16 inch diameter cast iron pipe with a reinforced concrete headwall.

Control: Mechanically-operated vertical slide gate mounted along the inside of the principal spillway riser.

SECTION 2: ENGINEERING DATA

2.1 DESIGN

a. Geology

The Batavia Kill Watershed Project Dam No. 3 is located in the "Appalachian Uplands" physiographic province of New York State. These uplands are the northern extreme of the Appalachian Plateau and were formed by dissection of the uplifted but flat-lying sandstones and shales of the Middle and Upper Devonian Catskill Delta (395 to 345 million years ago). Relief is high to moderate. Maximum dissection occurs in the Catskill Mountain area where only the mountain peaks approximate the original plateau surface. The present surficial soil deposits have resulted primarily from glaciations during the Cenozoic Era (most recent 65 million year period), the last of which was the Wisconsin glaciation approximately 11,000 years ago. These soils were deposited, in general, directly by glacier ice and are composed of unstratified rock fragments of all sizes ranging from boulders to clay particles. Locally intercalated lenses of sand and gravel are common where ice-laid and water-laid deposition occurs.

b. Subsurface Investigations

A subsurface investigation was conducted by the Soil Conservation Service, with Mr. Ronald C. Page in charge, in the Fall of 1967 and Winter of 1968. Applicable subsurface information is included in Appendix A. In general the surficial soils at the project site consist of a thin layer of topsoil and recent alluvium over sand and gravel outwash and ice contact deposits over glacial till, over sandstone to a maximum explored depth of 61.0 feet. Only boring DH #352 located in the principal spillway extended to bedrock. Observed water levels in the borings is highly variable, ranging from 1 foot below the surface to no water encountered.

An intercalated lense of very permeable gravel was encountered in boring #54 at a depth of 25 feet. Concern was expressed by the review agent (NYS D.O.T. Soil Mechanics Bureau) that this gravel, encountered below the cut-off trench, would promote the flow of subsurface seepage if not controlled. Additional subsurface investigations were progressed which indicated that the gravel was discontinuous and a natural blanket of less permeable material existed upstream of the deposit. As a precautionary measure the toe drain was extended toward the left abutment to collect any flow from this area.

c. Embankment and Appurtenant Structures

The dam was designed by the Soil Conservation Service who prepared a design report. Twenty two drawings were prepared for the construction of the dam of which portions of several are included in Appendix A.

Hydraulically, the dam was designed to retard the floodwaters of a 100 year frequency storm, without a discharge occurring in the emergency spillways.

2.2 CONSTRUCTION RECORDS

Complete as-built contract plans and documents were available from the SCS office having jurisdiction for Greene County.

2.3 OPERATION RECORD

Since the dam is an uncontrolled, floodwater retarding structure, no operating records are maintained regarding water levels. However, during periods of heavy rainfall, SCS personnel do monitor reservoir levels.

2.4 EVALUATION OF DATA

The data presented in this report has been compiled from information obtained from the Soil Conservation Service as well as the New York State Department of Environmental Conservation. It appears to be adequate and reliable for the purpose of the Phase 1 inspection.

SECTION 3: VISUAL INSPECTION

3.1 FINDINGS

a. General

Visual inspection of the BKWP Dam No. 3 and the surrounding watershed was conducted on July 11, 1978. The weather was clear and temperatures ranged in the seventies. The inspection was conducted during a basically dry period during which occasional thunderstorms occurred. The dam was impounding water at the time of inspection with the water level slightly higher than the principal spillway crest elevation.

b. Embankment

The earth embankment shows no signs of distress. The vertical and horizontal alignment of the crest appears to be unchanged, with no visible surface cracks appearing on the crest or embankment slopes. There was no apparent sloughing, subsidence, or depressions occurring either. No noticeable seepage on the downstream slope was observed. However, discharges estimated at less than 5 gpm per outlet were observed flowing from the internal drainage system indicating that the system is functioning satisfactorily. The upstream slope did not have any visible riprap placed at or near the level of the principal spillway crest elevation. No undesirable vegetative growth or animal penetrations into the slopes were observed. However, the heavy grass cover on the slopes was high, making visual inspection difficult.

c. Principal Spillway

The principal spillway consists of the vertical drop inlet structure, a concrete pressure pipe through the embankment, an impact basin, and an outlet channel. All of these components were in satisfactory condition.

d. Emergency Spillway

Two grass-lined emergency spillways, one each side and located in earth cuts, flank the main embankment. Both were in satisfactory condition except for the need for mowing.

e. Regulating Outlet

The reservoir drain conduit and slide gate are the components capable of regulating the reservoir whenever the pool level is below the principal spillway crest. The slide gate does operate.

f. Downstream Channel

The outlet channel quickly transitions into a steep sided V-shaped natural channel. The outlet channel riprap was in satisfactory condition but the V-channel side slopes were eroded. Some debris and logs were also scattered along the channel invert.

g. Reservoir

There was no noticeable signs of landslides or soil instability in the reservoir area.

3.2 EVALUATION OF OBSERVATIONS

Visual observations did not reveal any problems which would adversely affect the safety of the dam. Minor deficiencies may be corrected by maintenance efforts.

SECTION 4: OPERATION AND MAINTENANCE PROCEDURES

4.1 PROCEDURE

Normal water surface elevation is at the crest of the principal spillway. Downstream flows are limited by the capacity of the 30 inch diameter reinforced concrete pipe. The reservoir provides 952 acre-feet of storage between the crest of the principal spillway and the crest of the emergency spillways.

4.2 MAINTENANCE OF DAM

The dam and appurtenances are maintained by the owner. Normal maintenance consists primarily of mowing the grassed emergency spillway bottoms, which at the time of the inspection had been deferred.

4.3 WARNING SYSTEM IN EFFECT

No apparent warning system is present.

4.4 EVALUATION

Sufficient storage capacity is provided such that controlled release of impounded floodwaters by the principal spillway occurs in a safe manner. The dam and appurtenant structures are satisfactorily maintained with mowing of the emergency spillway bottoms required.

SECTION 5: HYDROLOGIC/HYDRAULIC

5.1 DRAINAGE AREA CHARACTERISTICS

Delineation of the watershed draining into the reservoir pool area was made using the USGS 7.5 minute quadrangle sheet for Hensonville, N.Y. The watershed consists of grassed fields and woodlands situated in a rural area. Relief ranges from moderate to steep, with the steeper slopes occurring in the upper reaches and along the sides of the watershed. The slope of the watershed is generally triangular with the dam located at the apex of the triangle.

5.2 ANALYSIS CRITERIA

The analysis of the floodwater retarding capability of this dam was performed using the "Dimensionless Hydrograph" method of the Soil Conservation Service and recommended spillway design flood criteria of the U.S. Army Corps of Engineers. The SCS method establishes the hydrograph peak inflow. A short-cut, approximation method of flood routing was then used to determine the reservoir storage/peak outflow conditions.

The Probable Maximum Flood 6-hour rainfall of 23 inches was selected using the Weather Bureau TP-40 (Ref. 1). Direct runoff was estimated at 20.3 inches. An SCS curve number (CN) of 80 was used to account for the soil and land use development within the watershed. The time of concentration of 1.32 hours was taken directly from the SCS design report summary.

5.3 SPILLWAY CAPACITY

The principal and emergency spillways are uncontrolled structures. The principal spillway operates under weir or orifice flow conditions depending upon the floodwater inflow to the reservoir pool. During orifice flow operation, pressure flow develops in the 30 inch conduit. The emergency spillways were analyzed as broad-crested weirs having a discharge coefficient, C, of 3.087.

The spillways have sufficient capacity for discharging the peak outflow from the PMF. For this storm, the peak inflow is 18500 cfs and the peak outflow is 15900 cfs. When the spillways are discharging the peak outflow, the water surface will be 0.5 feet below the top of dam.

5.4 RESERVOIR CAPACITY

Normal flood control storage capacity of the reservoir between the principal and emergency spillways is 952 acre-feet which is equivalent to a runoff depth of 5 inches over the drainage area. Surcharge storage capacity to the maximum high water elevation is an additional 440 acre-feet; equivalent to a runoff depth over the drainage area of 2.3 inches. Total storage capacity of the entire dam is 1415 acre-feet; equivalent to 7.4 inches of direct runoff.

5.5 FLOODS OF RECORD

The maximum known flood was reported as being 10 feet above the crest of the principal spillway. The data for this flood is as follows:

Elev. (Ft.)	Discharge (cfs)
1709.7	90

5.6 OVERTOPPING POTENTIAL

Analysis indicates the total discharge capability is sufficient to prevent overtopping from the PMF.

5.7 EVALUATION

This dam has sufficient capability to impound and adequately discharge floodwaters expected to result from the PMF.

SECTION 6: STRUCTURAL STABILITY

6.1 EVALUATION OF STRUCTURAL STABILITY

a. Visual Observations

No signs of major distress of the dam and appurtenances were observed during the inspection.

b. Design and Construction Data

The BKWP Dam No. 3 was designed in 1968 by the Soil Conservation Service. The design data and as-built drawings are available from the SCS office having jurisdiction for Greene County.

The design data included a stability analysis, included in Appendix A, of the downstream slope with steady state seepage from the emergency spillway crest. The minimum factor of safety under these conditions was 1.75. There were no other stability analyses performed on the earth embankment, spillways or cut slopes.

As-built drawings included in Appendix A indicated that there was a change in the location, extent and composition of the three zones in the embankment. Revised sheet 7 of 22, dated 1/27/71, shows the zones and materials that were specified. As-built sheet No. 27 shows the zones that were actually constructed. The changes in the zones are insignificant except possibly for the reduction in Zone 3 at the downstream toe of the embankment. This change reduced the amount of seepage water that the zone 3 material can collect and remove from the zone 2 material. However, this hasn't created a significant problem because no seepage or other signs of distress were observed on the downstream slope of the embankment. The internal drainage system was constructed as specified and it is apparently functioning satisfactorily.

The available design and construction data indicates that the embankment is stable and no further investigations are required. The zone changes in the embankment do not have a significant effect on the stability analysis which was performed during design stages.

c. Post-Construction Changes

No changes to the dam and appurtenances that would cause structural stability problems have occurred.

d. Seismic Stability

The dam is located near the boundary between seismic zones No. 1 and 2; therefore, no seismic analysis is considered warranted.

SECTION 7: ASSESSMENT/RECOMMENDATIONS

7.1 ASSESSMENT

a. Safety

The Phase 1 inspection of the BKWP Dam No. 3 did not indicate conditions which constitute a hazard to human life or property. The earth embankment is not considered to be unstable. The total discharge capacity of the spillways is adequate for the PMF.

The design of this dam includes an internal drainage system to control the phreatic surface and to provide a safe outlet for foundation and internal seepage.

b. Adequacy of Information

Information concerning the design and performance of this dam is considered adequate for the purposes required for Phase 1 inspections.

c. Need for Additional Investigations

No additional investigations are necessary at this time.

7.2 RECOMMENDED MEASURES

The following tasks should be undertaken by maintenance forces:

a. Mowing of the emergency spillway inverts.

b. Periodic operation and lubrication of the mechanically-operated slide gate mechanism to insure continued operation of the reservoir drain.

ZONE	MATERIAL 1/	MAX 2/ ROCK SIZE	MAX 3/ LIFT THICK	MINIMUM REQUIRED WATER CONTENT 4/	COMPACTION 6/	
					CLASS	DEFINITION
1	Materials A and B labelled on sheet 20 and represented by: TP 202 from 1.0' to 8.0' TP 213 From 1.5' to 11.0' TP 114 From 1.0' to 9.0' TP 115 From 1.0' to 9.0'	18"	24"	The water control of the material passing the 3/4" sieve shall be not less than 5 percent nor greater than percent, unless modified in the field by the engineer at the time of construction.		See Construction Specification 5
2	Represented by material in zone 1 plus materials and as labelled on sheet 20 and represented by TP 236 From 1.0' to 14.0' DH 251 From 10.5' to 15.' DH 254 From 6.5' to 25.5'	6		percentage points below optimum	A	100% standard density by ASTM D-698 Method A
3	Material as labelled on sheet 20 represented by TP 311 From 1.5' to 6.0' DH 351 From 1.5' to 7.5'	12	1	Wet 5/		See Construction Specification 5

1/ The placement table indicates estimated use of material. Materials I and as labelled on sheet 2 and represented by: 234 from 5.5' to 12.5' and 232 from 8.0' to 15.0' will be utilized in the downstream section of zones 2 and 3.

2/a. Maximum rock size placed in backfill compacted by means of hand tamping or manually directed power tampers or plate vibrators shall be 3".

b. Oversize material (greater than 6"), from zone 2, that is not used in the construction of the stone gutter will be utilized in zones and 3.

c. Oversize material (greater than 6") is to be graded within zones 1 and 3, so that the larger rocks are placed toward the outside slopes. Oversize material will not be exposed on the outside slopes.

3/ Maximum lift thickness prior to compaction.

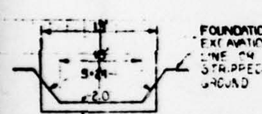
4/ Water content at time of compaction.

5/ Thoroughly wet but not so wet as to cause adherence of the soil to the wheels or tracks of equipment, nor to cause bogging down of equipment.

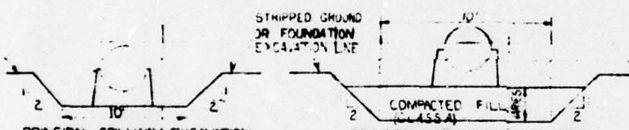
6/ For typical compaction curves see sheet 22.

CONSTRUCTION DETAILS

1. The foundation surface throughout the base area of the dam shall be scarified to a depth of 6 inches and compacted prior to placement of material.
2. Zone boundaries indicated are approximate. Adjustments will be made by the engineer to permit the contractor to utilize all useable required excavation within the neat lines of the embankment.
3. Topsoil that is suitable for use and not used in the specified area of the emergency spillway shall be incorporated within the slopes of the earth fill as directed by the engineer.



PRINCIPAL SPILLWAY EXCAVATION AT ANTI SEEP COLLARS



PRINCIPAL SPILLWAY EXCAVATION AT STA 1+35

TYPICAL FROM DOWNSTREAM END OF RISER TO UPSTREAM END OF IMPACT BASIN IN AREAS WHERE THE PRINCIPAL SPILLWAY EXCAVATION LINE IS THE SAME AS THE GRADE OF THE CRADLE BOTTOM

PRINCIPAL SPILLWAY EXCAVATION AT STA 4+00

TYPICAL FROM DOWNSTREAM END OF RISER TO UPSTREAM END OF IMPACT BASIN IN AREAS WHERE THE PRINCIPAL SPILLWAY EXCAVATION LINE IS BELOW THE GRADE OF THE CRADLE BOTTOM

DRAINAGE SYSTEM DETAILS

1. ALL DRAIN PIPE SHALL CONFORM TO SPEC. 110 AND SHALL BE 10" DIA., SHAPE I CLASS I (ANNULAR CORRUGATIONS), OR CLASS II (HELICAL CORRUGATIONS); TYPE A (FULLY BITUMINOUS COATED) PIPE.
2. USE A MINIMUM OF 12" OF DRAIN FILL AROUND PIPE.
3. THE PROFILES AT THE BOTTOM OF ALL EXCAVATIONS AS SHOWN ARE ONLY APPROX. THE REQUIRED FINISHED GRADES WILL BE ESTABLISHED IN THE FIELD AT TIME OF CONSTRUCTION BY THE ENGINEER.

MATERIAL DESCRIPTIONS

A

Silt-sandy, trace to 5% gravel, 20-25% well graded sand, rest fines, brown, slightly moist, moderately permeable (k = 2.1 ft./day), medium to hard (N = 5-78, average 28 blows/ft), derived from till through weathering and erosion. Sample 4.1 (ML)

B

Gravel-silty, trace to 10% +6" material (some boulders), 35-40% gravel, 30% sand, 30-40% slightly plastic fines, red-brown, moist, relatively impermeable, dense to very dense (N = 33-84, average 57 blows/ft.), glacial till.
Samples: 501.1, 109.1, 207.1 (GM)

C

Gravel-sandy, trace of +6" material, 50-55% gravel, 35-40% sand, rest fines, occurs as interbedded sands and gravels w/occasional silt seams, brown, moist, moderately permeable (one test only, 2.4 ft./day), dense (N = 30-72 blows/ft), outwash. (GW-GM)
Samples: 3.1, 502.1

D

Silt-sandy, occasional +6" material, 5-10% gravel, 25-30% sand, 60-65% non-plastic silt, occurs as interbedded silts, sands, and gravels - description is a composite sample, brown, moist to saturated, moderately permeable (k = 0.0-21.4 averaging 3.0 ft./day), compact (N = 10-75, average 37 blows/ft), glacial lacustrine. Sample 105.1 (ML)

E

Silt-clayey, occasional pieces of gravel, 10-15% fine and very fine sand; rest non-plastic fines, brown, moist, slightly permeable (k = 0.2-2.8 ft/day), firm (N = 17-39, average 30 blows/ft), glacial lacustrine.
Sample 206.1 (ML)

F

Sand-silty, trace of +6" material, 15% gravel, 60-65% well graded sand, 20-25% non-plastic fines; brown, moist, moderate permeability, compact (N = 27-118 average 53 blows/ft.), possible lacustrine. Sample 204.1 (SM)

G

Sand-silty, brown, moist, moderately plastic, relatively impermeable, hard (n = 53-190, average 113 blows/ft), glacial till. (SM)
Composite sample G

H

Sand-gravelly, 40-45% gravel, 45-50% sand, 15% fines, brown, moist, moderate to rapid permeability (k = 0.2-8.8 average 4.6 ft./day), very dense (N = 29-100, average 51 blows/ft.), valley fill deposit. Sample 501.2 (SM)

I

Sand-gravelly, 30-35% gravel, 55-60% sand, 10% non-plastic fines, brown, moist, moderate permeability, firm, outwash. (SW-SM)
Sample 503.1

J

Recent alluvium - gravel - sandy, 5% +6" material, loose, rapid permeability, test holes cave badly and rapidly fill with water.

K

Topsoil, loose - organic matter, some stones and boulders - reddish-brown - permeable - average depth 1.0'.

BATAVIA KILL #3
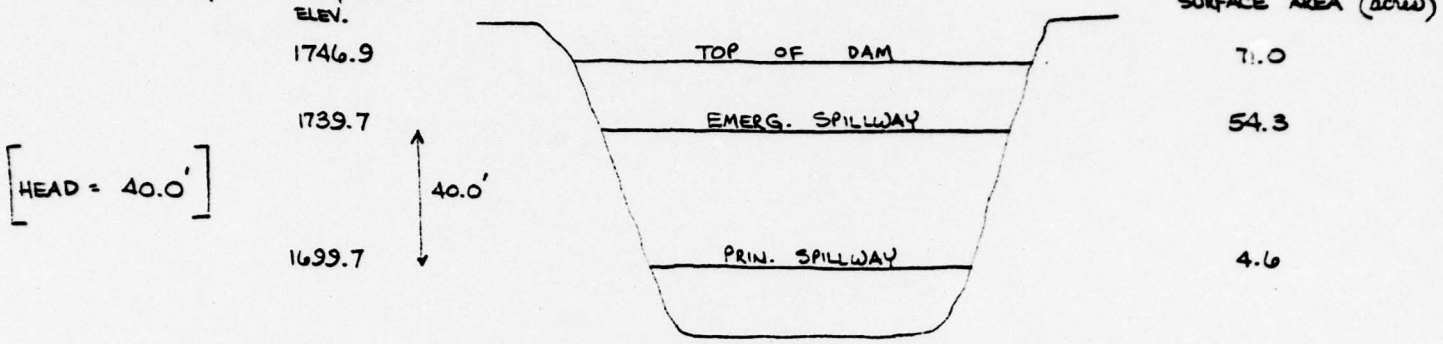
#191C - 3818

SPILLWAY ANALYSIS :



Reservoir Detention Volume (RDV) :

$$RDV = A \times h = \left(\frac{54.3 + 4.6}{2}\right)(40.0) = 1178.0 \text{ AF}$$

Inflow Runoff Volume (IRV) :

$$IRV = \frac{Q}{12} \times A_{DR} = \frac{20.3}{12} \times 2304 = 3397.6 \text{ AF}$$

Ratio : $\frac{RDV}{IRV} = \frac{1178}{3397.6} = .302$

Ratio : $\frac{OPR}{IPR} = .86$

$$OPR = (.86)\,IPR = (.86)(18503) = 15913 \text{ cfs}$$ [OUTFLOW PEAK RATE]
